### **Explain Normalization and Denormalization with examples?**

Normalization is a process of organizing the data in database to avoid data redundancy, insertion anomaly, update anomaly & deletion anomaly. Let's discuss about anomalies first then we will discuss normal forms with examples. Anomalies in DBMS. There are three types of anomalies that occur when the database is not normalized.

As discussed in a past article the Address Book Normalization process of OCS is a barely-documented and often misunderstood process. The objective of this blog article is to explain how this process works now in Lync Server 2010. Overall the process is generally the same, but with a few minor changes that impact both how it is configured and how normalization functions.
